

# Physical Database Design

# What is index ?

```
graph TD; A[What is index ?] --> B[Data structure associated with a table or view to help database engine to retrieve data very fast]; A --> C[Type of data structure :]; C --> D[usually but not always the data structure is B-tree]; C --> E[the type of data structure is depend on some factors like : type of index , type of sql provider like : oracle , sql server or mysql ... and so on];
```

Data structure associated with a table or view to help database engine to retrieve data very fast

Type of data structure :

usually but not always the data structure is B-tree

the type of data structure is depend on some factors like : type of index , type of sql provider like : oracle , sql server or mysql ... and so on

## Types Of SQL Queries That Can Use Indexes :

## Advantages Of indexes :)

```
graph TD; A[Advantages Of indexes :)]; A --- B[Help database engine to retrieve data or execute select queries very fast with high performance]; A --- C[Help database engine to load minimum number of pages or rows from disk to memory]; A --- D[save database server memory or buffers space as possible];
```

Help database engine to retrieve data or execute select queries very fast with high performance

Help database engine to load minimum number of pages or rows from disk to memory

save database server memory or buffers space as possible

## Disadvantages of indexes :(

indexes increase performance of read queries but when there a lot of indexes this will be decrease performance of write queries like : insert , update , delete.

indexes need extra space

the two previous problems can be solved if you design your index correctly and understand your business and needs

# Main Types Of indexes :

Clustered index

Non Clustered index

Column index

Filtered index

Hash index

Unique index

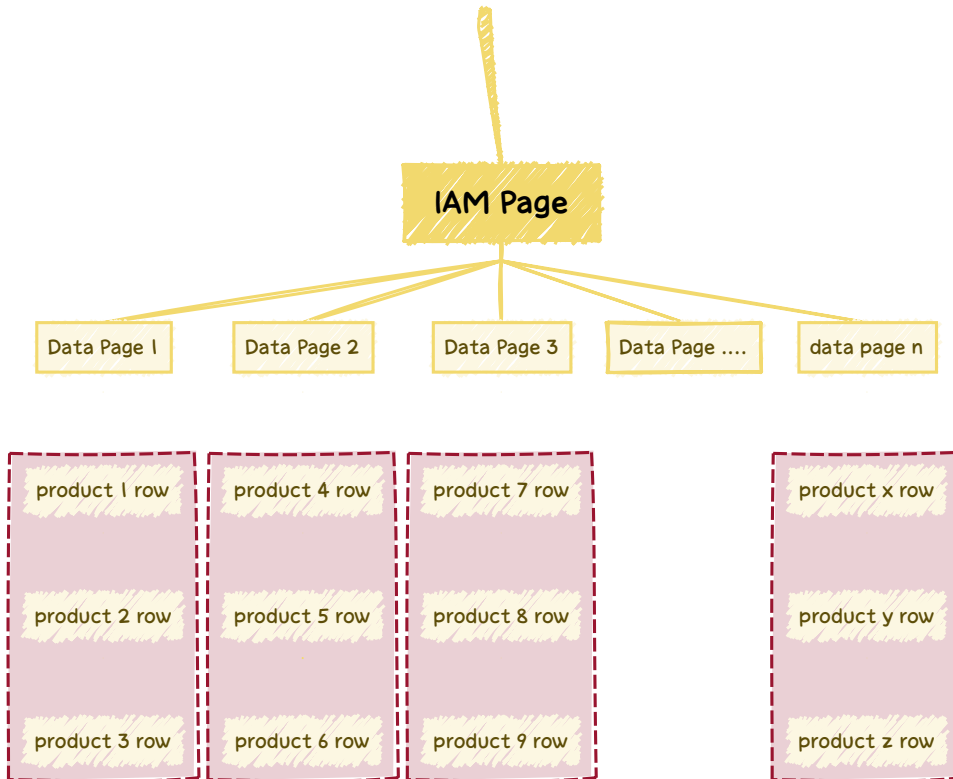

## Heap Table

Table does not contain any cluster index

1. Create Product Table Without any index or primary key

```
CREATE TABLE [dbo].[Product] (  
  [ID] [int] NOT NULL,  
  [Name] [nvarchar](255) NULL,  
  [Price] [int] NULL,  
  [AvailableQuantity] [int] NULL  
)  
GO
```

# Product Heap Table Physical Representation

## Table Heap

```
graph LR; A[Table Heap] --- B[2. insert 1 million rows using data generator tools like : spawner]; A --- C[spawner tool and all scripts will be attached on the repository on github];
```

2. insert 1 million rows using data generator tools like : spawner

spawner tool and all scripts will be attached on the repository on github

Product				
ID	Name	Price	Available Quantity	Page ID
1	Product 1	20	5	1
2	Product 2	10	2	1
3	Product 3	40	6	1
4	Product 4	70	3	2
5	Product 5	5	7	2
6	Product 6	120	1	2
..... .....				
1,000,000	Product 1,000,000	15	8	N

# Table Scan

```
graph LR; A[Table Scan] --- B[When?]; A --- C[how table scan work?]; B --- D[1. Table dose not has any indexes in general]; B --- E[2. Table can has some indexes , but all columns in the where condition does not have any index]; B --- F[ex : product table has index on id column but has not on name column]; B --- G[select * from product where name = 'apple' --> table scan]; C --- H[1. read and load all pages or rows for this table from disk to memory]; C --- I[2. loop on all rows on database server memory]; C --- J[3. filter the rows by where conditions and return only the rows which meet the conditions to client.];
```

## When ?

1. Table dose not has any indexes in general
  2. Table can has some indexes , but all columns in the where condition does not have any index
- ex : product table has index on id column but has not on name column
- select \* from product where name = 'apple' --> table scan

## how table scan work ?

1. read and load all pages or rows for this table from disk to memory
2. loop on all rows on database server memory
3. filter the rows by where conditions and return only the rows which meet the conditions to client.

## Table Scan Complexity

```
graph LR; A[Table Scan Complexity] --- B[algorithm : Linear Search]; A --- C["Time Complexity : O(n)  
Because The Algorithm Need To Loop on All rows on Memory"]; A --- D["Space Complexity : O(n)  
Because the engine need to read and load all rows and pages from memory"]
```

algorithm : Linear Search

Time Complexity :  $O(n)$   
Because The Algorithm Need To Loop on All rows on Memory

Space Complexity :  $O(n)$   
Because the engine need to read and load all rows and pages from memory

## Heap Table

```
graph LR; A[Heap Table] --- B[3. Run this Query and Open Estimated Execution Plan]; A --- C[SELECT * FROM [dbo].[Product] WHERE ID = 666666]; A --- D[The Result as you see on The Next Image , Read and Load All Rows To Return Only One Row];
```

3. Run this Query and Open Estimated Execution Plan

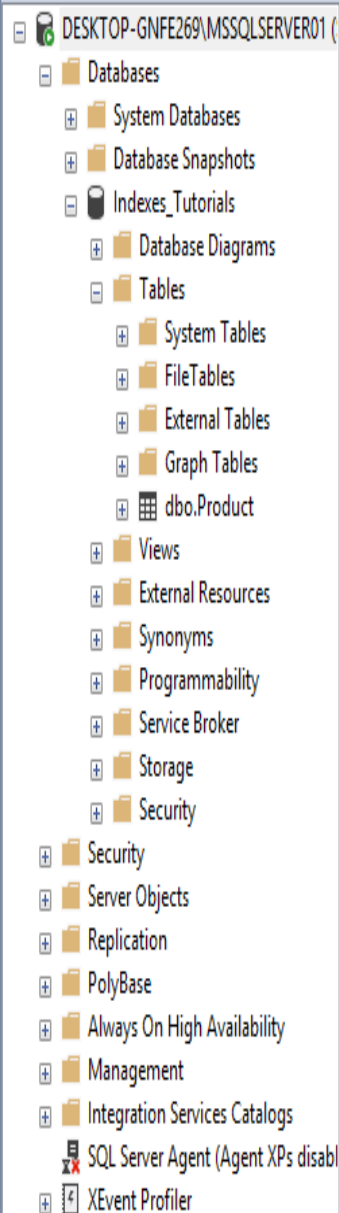

```
SELECT * FROM [dbo].[Product]  
WHERE ID = 666666
```

The Result as you see on The Next Image , Read and Load All Rows To Return Only One Row

Object Explorer

Connect

SQLQuery2.sql - DE...FE269\lenovo (55))\* SQLQuery1.sql - DE...FE269\lenovo (53))\*

```

/*
select product with id = 666666 when there is no any index
*/
SELECT * FROM [dbo].[Product]
WHERE ID = 666666
    
```

100 %

Messages Execution plan

Query 1: Query cost (relative to the batch) is 5.50435 (95%).  
 SELECT \* FROM [dbo].[Product] WHERE ID = 666666  
 Missing Index (Impact 99.439): CREATE NONCLUSTERED INDEX [IX\_Product\_ID] ON [dbo].[Product] ([ID])

### Table Scan

Scan rows from a table.	
Physical Operation	Table Scan
Logical Operation	Table Scan
Estimated Execution Mode	Row
Storage	RowStore
Estimated Operator Cost	5.50435 (95%)
Estimated I/O Cost	4.95431
Estimated Subtree Cost	5.50435
Estimated CPU Cost	0.550039
Estimated Number of Executions	1
Estimated Number of Rows to be Read	1000000
Estimated Number of Rows for All Executions	1.01348
Estimated Number of Rows Per Execution	1.01348
Estimated Row Size	278 B
Ordered	False
Node ID	1
Predicate	[Indexes_Tutorials].[dbo].[Product].[ID]=[@1]
Object	[Indexes_Tutorials].[dbo].[Product]
Output List	[Indexes_Tutorials].[dbo].[Product].ID, [Indexes_Tutorials].[dbo].[Product].Name, [Indexes_Tutorials].[dbo].[Product].Price, [Indexes_Tutorials].[dbo].[Product].AvailableQuantity

Query executed successfully.
